

Task 3: File Automation with Python Scripts

Project Overview

This project automates the process of moving JPG image files from a source folder to a destination folder using Python. The application reduces manual effort and demonstrates practical automation skills using file handling and directory management.

Objectives

The goal of this project is to automate repetitive file management tasks. Users can move multiple JPG files automatically instead of manually organizing files.

Technologies Used

Python, Tkinter, OS Module, Shutil Module, File Handling, Git, and GitHub.

Key Features

- Detects JPG files automatically.
- Creates destination folder when required.
- Moves image files safely.
- Displays moved file names and total count.
- Includes a Tkinter graphical interface.
- Uses an attractive dark-themed design.

Working Process

The script scans the source folder, identifies JPG files, and moves them to the destination folder using the shutil module. The GUI allows users to perform the operation with a single button click and view results instantly.

Learning Outcomes

This project helped develop skills in Python automation, file handling, GUI development, problem-solving, and version control with Git and GitHub.

Conclusion

The File Automation project demonstrates how Python can simplify repetitive tasks through automation. It is a practical project that improves efficiency while strengthening programming knowledge.
